

Screenshot that could prove the technical limitations & also show the convo for further transparency :

This what the laptop showed:

And below is when i tried to do it from the phone , still hasnt worked:

Here the prompts ive used to get chatgpt ot help with the debugging : as you can see ive used images to explain so thats also another reason why chatgpt fails to make a sharable link : hope this suffices as a reference and demonstrate transparency:

The page crashed , fix the issue that's addressed in the console section

📄 < 4/4 >

Thought for 34s

You've got a crash because two components are importing a named export `api` that your file doesn't (consistently) provide. That's why DevTools says:

```
"/src/api.js does not provide an export named 'api' ..."
```

The safest fix is to **default-import** the helper everywhere (so it works whether or not the named export exists) and keep your `searchUsers` named export as-is.

1) Update the imports in the two pages

client/src/pages/User.jsx

diff

📄 Copy code

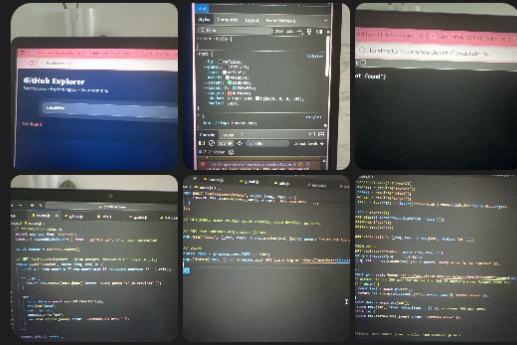

```
- import { api } from '../api.js';  
+ import api from '../api.js';
```

client/src/pages/Repo.jsx

+ Ask anything

Still having a search issue related to the server . Analyze the pics and look for what's causing it

📄 < 3/3 >

Thanks for sharing the screenshots — this helps a lot.

I can see exactly why your search is failing:

🔍 Problems in your server code

1. You have two different route definitions for `/api/search/users` :

- One in `routes.js`
- Another directly in `index.js`

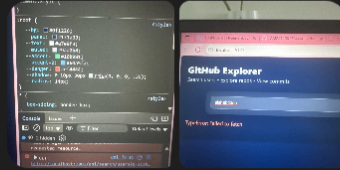

→ This causes confusion and may result in the wrong handler being used.

2. Your client is calling:

bash

📄 Copy code

Why can't it fetch my GitHub username is it not connected to the GitHub database

📄 < 2/2 >

Thought for 41s

You're very close. The error you're seeing now:

pgsql

📄 Copy code

```
GET http://localhost:3001/api/search/users?q=aishabtidon 404 (Not Found)
TypeError: Failed to fetch
```

means the client reached your server on port 3001, but the server doesn't have a matching route (or you're still running an old server process that doesn't have the new route yet).

Two common reasons:
